FourxClub: A Practical Guide to Institutional-Based Intraday Trading

Introduction: Why Most Traders Lose (and How We Are Different)

The vast majority of traders fail because they rely solely on technical tools and indicators without understanding the fundamental drivers of market movement. They don't know why the market is moving from a specific point.

Our Institutional Edge

Our strategy is distinct because it is based on the methods used by institutions. Large institutional players primarily trade using Quants and Order Flow analysis, tools that are typically unaffordable for retail traders.

Our Solution: We have developed a proprietary strategy that allows you to leverage the concepts of institutional tools within free platforms like TradingView, achieving an estimated 70-80% accuracy comparable to institutional methods.

💡 The Core Framework: Time, Liquidity, & Structure

This document introduces the foundational principles of our trading approach. It is designed to build understanding, not dependency.

Mastery comes from screen time, not secrets.

1. How the Market Really Moves (A Simple Truth)

Price is an advertising mechanism. It moves to facilitate trade between buyers and sellers.

The market is a two way auction. Price moves up to find sellers. Price moves down to find buyers. When both sides agree on value price rotates (balance). When one side overpowers the other price trends (imbalance).

Auction Market Theory (AMT) The Framework:

- How long price stays at a level. More time = acceptance. Less time = rejection.
- Volume The fuel. Shows conviction. High volume at a price = fair value. Low volume = rejection.

2. Defining "Liquidity" in Our Framework

Forget the textbook nonsense about "ability to buy/sell without moving price." That's a consequence, not the definition.

In our framework:

Liquidity = resting limit orders (passive orders) that provide the counterparty for aggressive market orders.

Where Liquidity Pools:

Liquidity doesn't distribute randomly. It clusters at psychological levels where traders place orders:

High Liquidity Zones (where orders stack):

- Round numbers - \$60,000, \$65,000, \$70,000
- Previous highs/lows - swing points, daily/weekly highs
- Value Area boundaries - POC, VAH, VAL from previous sessions
- Untested levels - gaps, single prints, virgin TPOs
- Stop clusters - just beyond swing points (stop loss liquidity)

3. Time Is Not Optional (The Volume Catalyst)

What Time Tells You:

Time Spent

Meaning

High time at price

Acceptance - Fair value - Real S/R

Low time at price

Rejection - Unfair value - Will revisit

- More time = both sides agree = balance forming.
- Less time = one side dominated = initiative move.

Time vs Volume:

- Volume without time = manipulation.
- Volume + Time = conviction.

4. Value Area & Market Profile Structure

Value Area is where 70% of trading activity occurred. It represents the price range where buyers and sellers agreed on fair value.

The market is an auction. Value Area shows you where the auction settled where both sides said "this price is acceptable." Everything outside value is rejection everything inside value is acceptance.

The Three Levels:

- i. POC (Point of Control) - The single price with the most volume and most time. This is fair value. The price where maximum agreement occurred. Acts as the strongest magnet and the strongest support/resistance level.

- ii. VAH (Value Area High) - The upper boundary of the 70% zone. Price above VAH is considered expensive. Sellers become interested. Buyers hesitate.
 - iii. VAL (Value Area Low) - The lower boundary of the 70% zone. Price below VAL is considered cheap. Buyers become interested. Sellers hesitate dominated by the New York session.
- Pre-NY price action is usually positioning and liquidity building.
 - London moves are often corrective or deceptive.
 - True intent appears after NY Open when real volume enters.

How To Use It:

- Price above value - Market is bullish buyers in control, Look for longs on pullbacks to VAH.
- Price below value - Market is bearish sellers in control, Look for shorts on rallies to VAL.
- Price inside value - Market is balanced rotational, Fade the extremes or wait for breakout.
- Price at POC - Decision point either holds as support/resistance or gets sliced through. Watch order flow for confirmation.

Value Area Transitions:

The real edge comes from watching how price interacts with previous value areas.

- Price opens above previous VAH and holds - bullish continuation. Previous resistance is now support.

- Price opens above previous VAH and falls back inside - failed breakout. Trapped longs. Look for shorts.

- Price opens below previous VAL and holds - bearish continuation. Previous support is now resistance.
- Price opens below previous VAL and reclaims - failed breakdown. Trapped shorts. Look for longs.

5. Day Types & Profile Shapes

Every session prints a profile. That profile has a shape. The shape tells you if buyers dominated, sellers dominated, or neither side won.

- Normal Day
 - Wide value area range established early.
 - Price rotates inside value area all day.
 - Profile shape: Fat, symmetrical.
 - Strategy: Fade the edges. Target POC.

ii. Normal Variation Day

- Moderate value area. One breakout attempt.
- Extends 0.5x - 1x value area then rotates.
- Profile shape: Slightly extended
- Strategy: Fade failed extensions.

iii. Trend Day

- Narrow value area, breaks and never looks back.
- Extends 1.5x - 2x+ value area one direction.
- Profile shape: Thin & single distribution.
- Strategy: Never fade, join on pullbacks.

iv. Double Distribution Day

- Two separate value areas form.
- Price trends, consolidates, then trends again.
- Profile shape: Two bulges connected by thin prints.

6. Why We Use Minimal Indicators

- Indicators do not predict the market; they are a secondary tool used to filter decisions.
- We use very few tools because:
- Too many indicators create conflicting signals.
- Price and time already tell the most important part of the story.
- Indicators are used for confirmation, never as the primary signal for entry.

7. Trade Setups

8. Risk Is the Real Strategy

- A good setup can still result in a loss, but a bad risk plan always loses in the long run.
- Key Risk Control Principles:
- Maintain the same risk percentage per trade.
- Follow the same process every day.
- Avoid emotional sizing (increasing/decreasing risk based on feeling).
- Zero revenge trades.
- Consistency comes from risk control, not win rate.

9. Why This Is a Framework, not a Signal System

- This approach is designed to be robust:
- It adapts to different market conditions.
- It works across various instruments (Forex, Indices, Commodities).
- It evolves and improves with screen time.
- There are no fixed, "copy-paste" entry signals. We train you to read the full market context, not candles in isolation.

10. Final Thought

- This document provides you with: the logic, the structure, and the mindset.
- What it does not provide: exact entries, mechanical rules, or shortcuts.
- Those are earned through disciplined observation and execution. The market rewards patience, not urgency.

Ready to Trade the Institutional Way?

The 4x Club Advanced Trading Course converts the framework you just learned into a high-probability, step-by-step mechanical system.

What You Get in the Full Course:

The Institutional Tool Walkthrough: How to use the free institutional-grade tool on TradingView for your 70-80% accuracy edge.

Our Institutional Auction Market Theory Model, 3-Step Execution Checklist: Our precise entry/exit rule-set for executing the Liquidity/Time/Structure framework.

Live Market Examples: 10+ hours of trading sessions and market breakdowns on FOREX, GER30, NASDAQ, and Gold.

Exclusive Community Access: Daily analysis and Q&A sessions to fast-track your screen time.

Stop Trading Blind. Start Trading Smart.
